*Macrocneme adonis*, Druce, Biol. Centr.-Am., Het. i. p. 48, pl. 6. f. 16 (1884); Kirby, Cat. Het. p. 129.

Black; antennæ white at tips; palpi at base, frons, tegulæ, shoulders, pectus, and fore coxæ with paired white points; thorax suffused with metallic blue; abdomen suffused with golden green, the 1st segment with paired dorsal and lateral white points, the 2nd segment with lateral and sublateral points, and the next two segments with ventral points. Fore wing with oblique basal patch of metallic green and a streak on medial part of inner margin; the area from middle to near termen suffused with metallic blue. Hind wing with more or less developed patch of metallic blue.

Ab. 1. The specimen, figured from Chiriqui, has no blue on apical area of fore wing, and a black streak from it to discocellulars.
